Table 1

Variable	All CONUS observations	Overall inventory analysis
Monitors (n)	168	140
Quasi-daily observations (n)	741,861	558,915
Gross beta radioactivity (mBq/m³)	0.348 (0.219, 0.429)	0.354 (0.228, 0.437)
Surface U-238 proxy (ppm)	1.81 (1.54, 2.14)	1.82 (1.60, 2.13)
Continental air-mass proportion	0.77 (0.59, 1.00)	0.79 (0.64, 1.00)
PM2.5 (µg/m³)	9.25 (5.94, 11.25)	9.28 (6.03, 11.35)
Soil moisture (kg/m²)	521.610 (425.029, 617.866)	522.056 (427.840, 618.557)
Relative humidity (%)	70.6 (63.1, 82.7)	70.1 (63.2, 81.8)
Temperature (°C)	13.85 (6.39, 22.10)	14.40 (6.90, 22.69)
Planetary boundary layer height (km)	0.91 (0.59, 1.13)	0.87 (0.58, 1.06)
Wind speed (m/s)	3.40 (2.03, 4.40)	2.99 (1.95, 3.97)
Monthly sunspots (n)	61.29 (13.90, 97.57)	61.40 (13.90, 97.57)
Upwind power plants within 20 km (n)	1.96 (0.00, 2.00)	2.02 (0.00, 3.00)

Characteristics of observations in the overall inventory analysis. Continuous values are means with the 25th and 75th percentiles in parentheses; these are not confidence intervals. The original column labelled Primary analysis has been clarified to Overall inventory analysis. The table describes 140-monitor quasi-daily models and does not summarize the separate 133-monitor CAMPD filter-period sample. No between-column hypothesis test is performed.
